

***Jejunum & Ileum.**

Jejunum and Ileum: Location and Description

- ❑ The upper 2/5 of intestine make up jejunum & lower 3/5 to ileum.
- ❑ Jejunum begin at duodenojejunal flexure & ileum ends at ileocecal junction.
- ❑ The coils of jejunum & ileum are freely mobile & attached to posterior abdominal wall by a fan-shaped fold of peritoneum known as **mesentery of small intestine.**

□ The root of mesentery permits entrance & exit of branches of superior mesenteric artery & vein, lymph vessels & nerves .

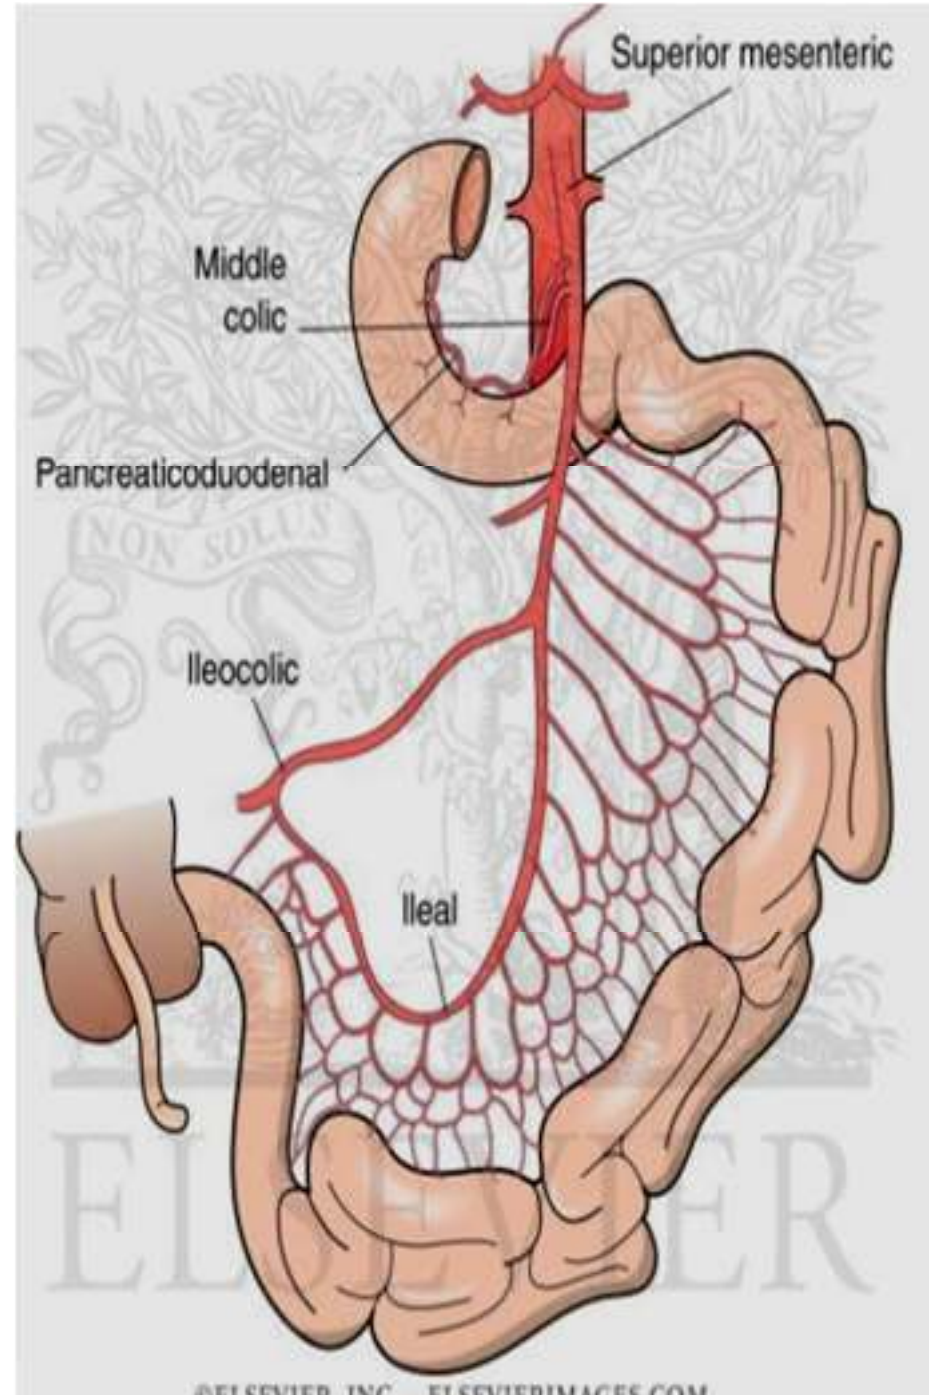

Blood Supply

Arteries:

- ❑ Branches of the superior mesenteric artery .
- ❑ The lowest part of the ileum is also supplied by ileocolic artery.

Veins:

Superior mesenteric vein

Lymph Drainage:

The superior mesenteric nodes

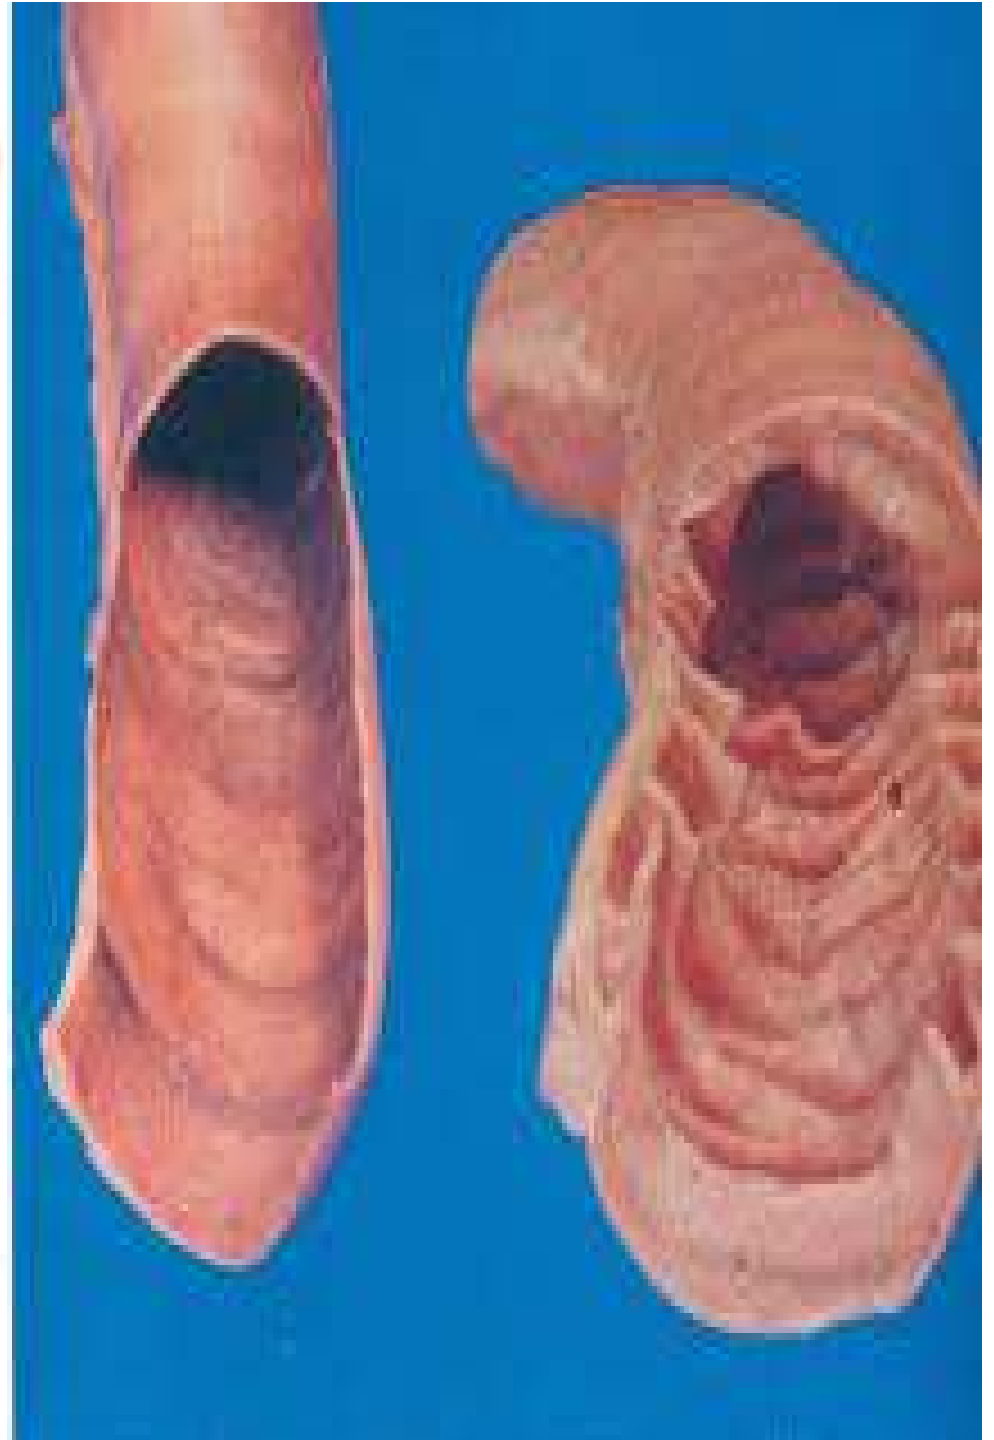

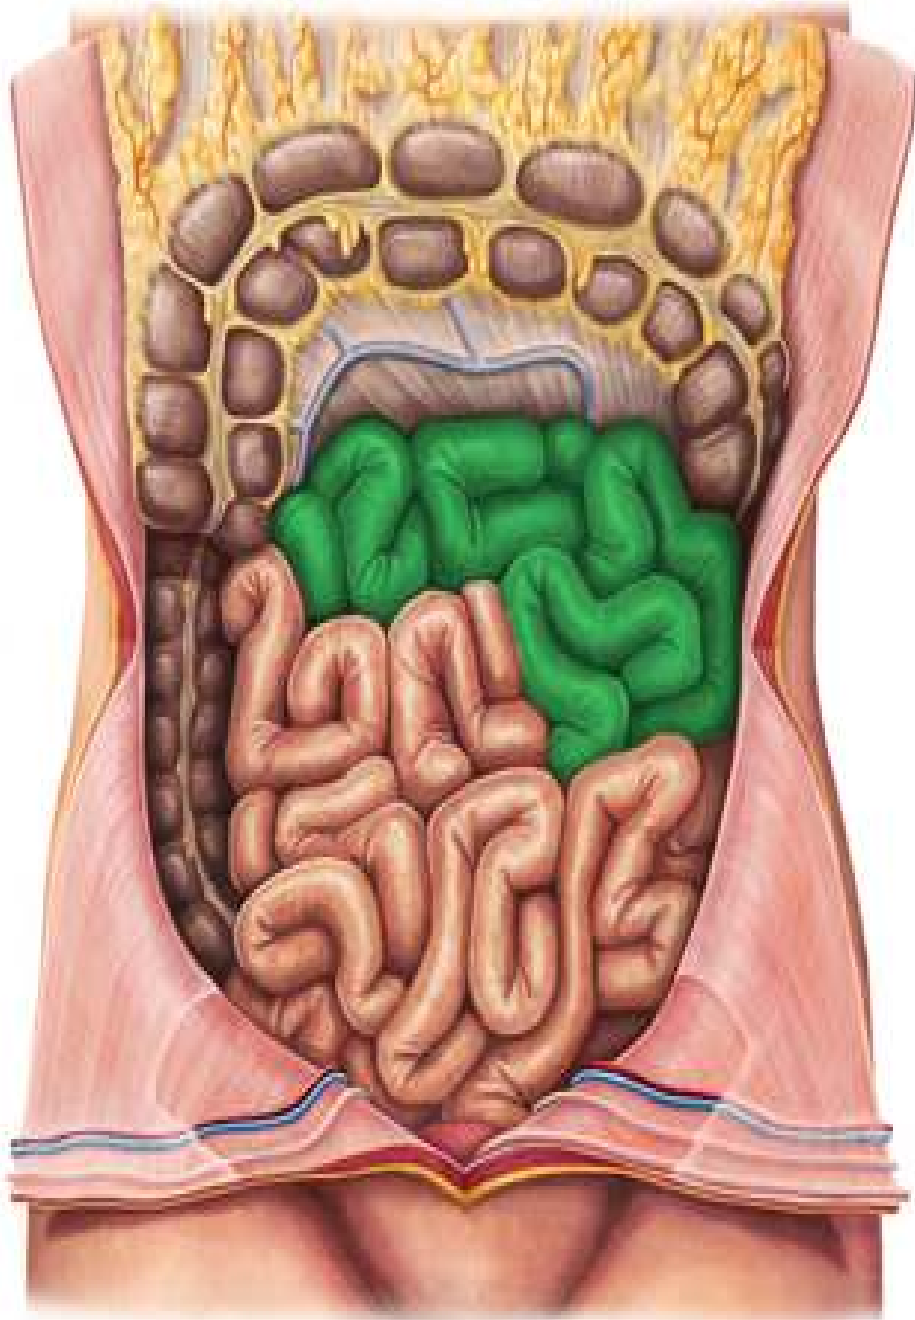

Nerve Supply:

- 1) Sympathetic.
- 2) Parasympathetic (vagus)
nerves from the superior
mesenteric plexus.

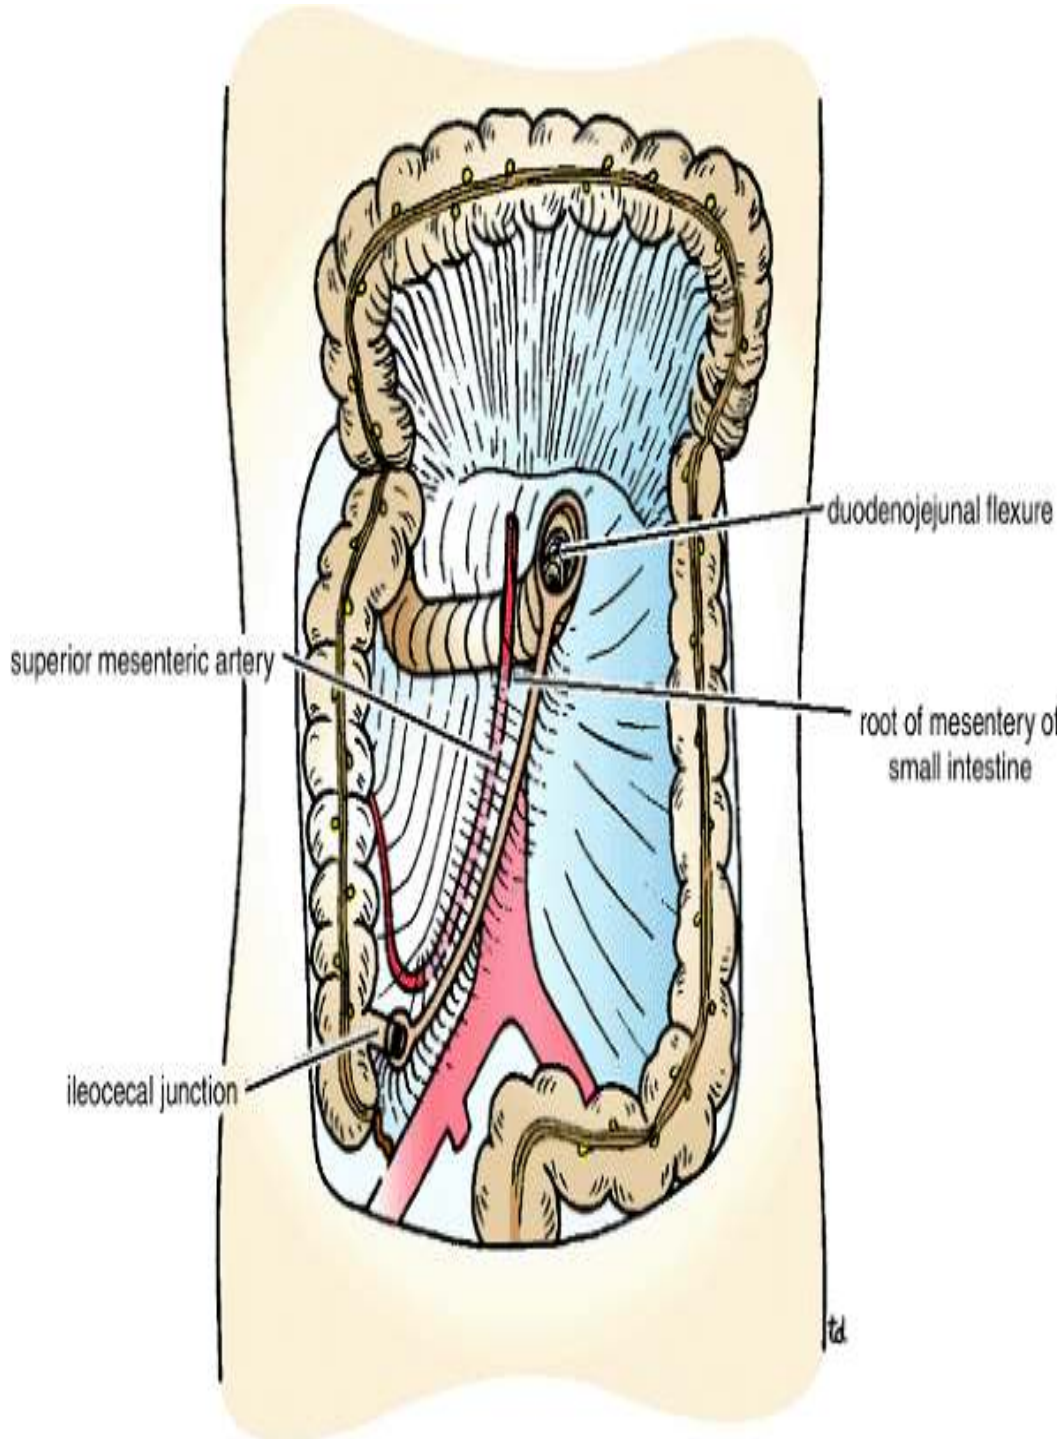

Jejunum & ileum differences

Jejunum	ileum
❖ Location: upper part of peritoneal cavity.	❖ Location: Lower part of peritoneal cavity & in pelvis.
❖ Wider bored, thicker walled, & redder than ileum.	❖ Narrow, thin wall, pink color.
❖ The plicae circulares, are larger, more numerous & closely set in the jejunum	❖ Upper part of ileum they are smaller & more widely separated & in lower part they began to absent.

<p>❖ Mesentery: is attached to the posterior abdominal wall above & to left of aorta</p>	<p>❖ Mesentery: Below and to right of the aorta.</p>
<p>❖ Arcades : jejunal mesenteric vessels form only 1 or 2 arcades, with long branches passing to intestinal wall .</p>	<p>❖ Arcades : ileum receives numerous short terminal vessels that arise from a series of 3 or 4 or even more arcades</p>
<p>❖ No peyer's patches.</p>	<p>❖ Aggregations of lymphoid tissue (Peyer's patches) are present in the mucous membrane of lower ileum</p>
<p>❖ Jejunal end of the mesentery, the fat is deposited near the root and is scanty near intestinal wall</p>	<p>❖ The fat is deposited throughout so that it extends from the root to intestinal wall</p>

ileum

I intestine

Peyer's patch

Large Intestine:

The large intestine extends from the ileum to the anus.

The function :

- 1) Absorption of water and electrolytes .
- 2) Storage of undigested material until it can be expelled from the body as feces.

Anatomy of the Digestive System (Reflected Small Intestine)
Normal Anatomy of the Digestive System

Cecum

Location:

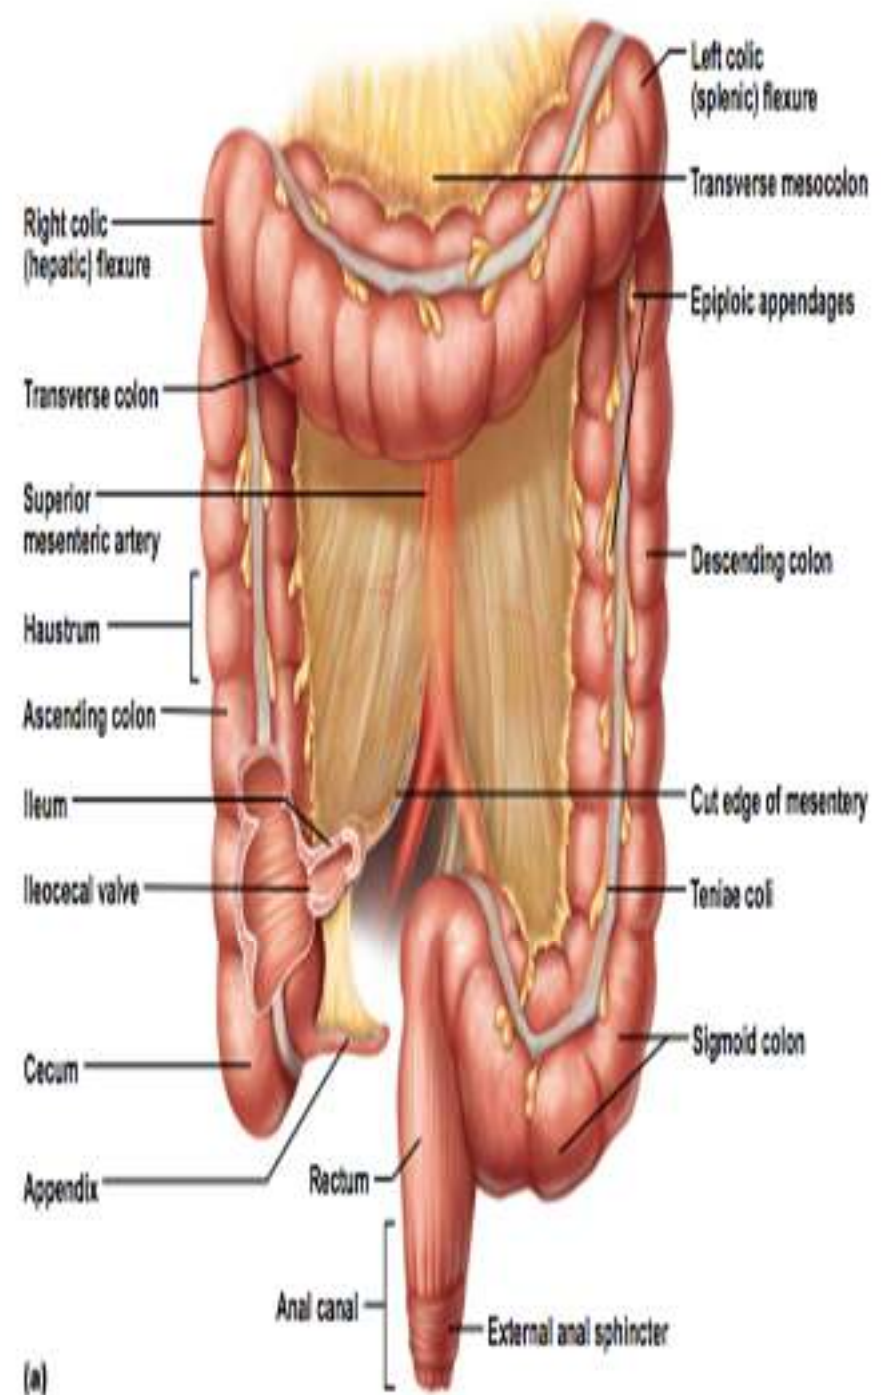

Right iliac fossa

Description:

- It is a blind-ended pouch **about 6 cm long**. It possesses a considerable amount of mobility, although it does not have a mesentery. The appendix attached to posteromedial surface of cecum.

- The longitudinal muscle is restricted to 3 flat bands **teniae coli** which converge on base of appendix.
- The cecum is often distended with gas.
- The opening between ileum & cecum is provided with two folds **ileocecal valve**.
- The appendix communicates with cavity of cecum through opening located below & behind ileocecal opening.

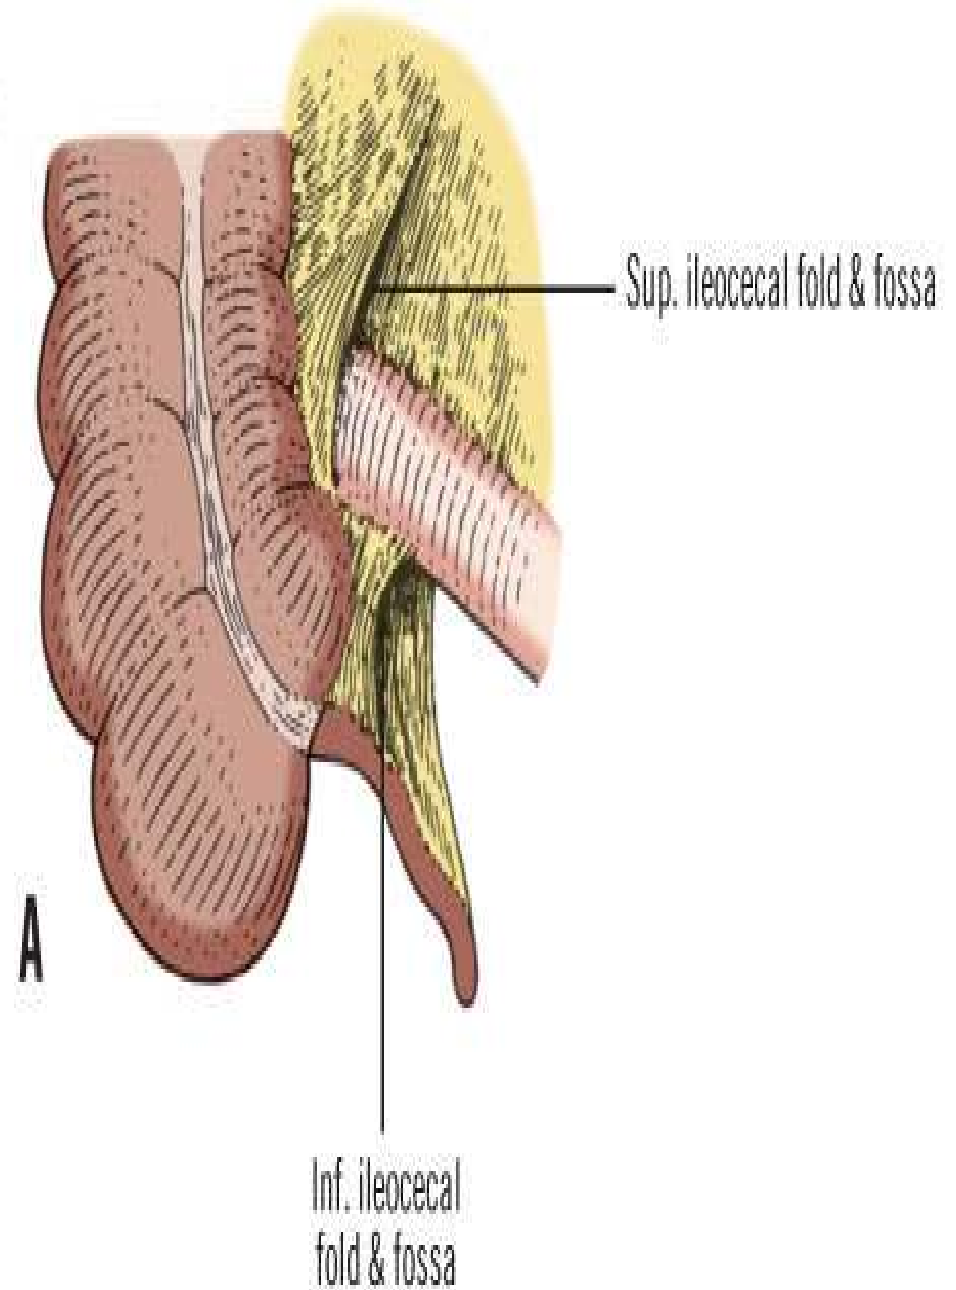

(a)

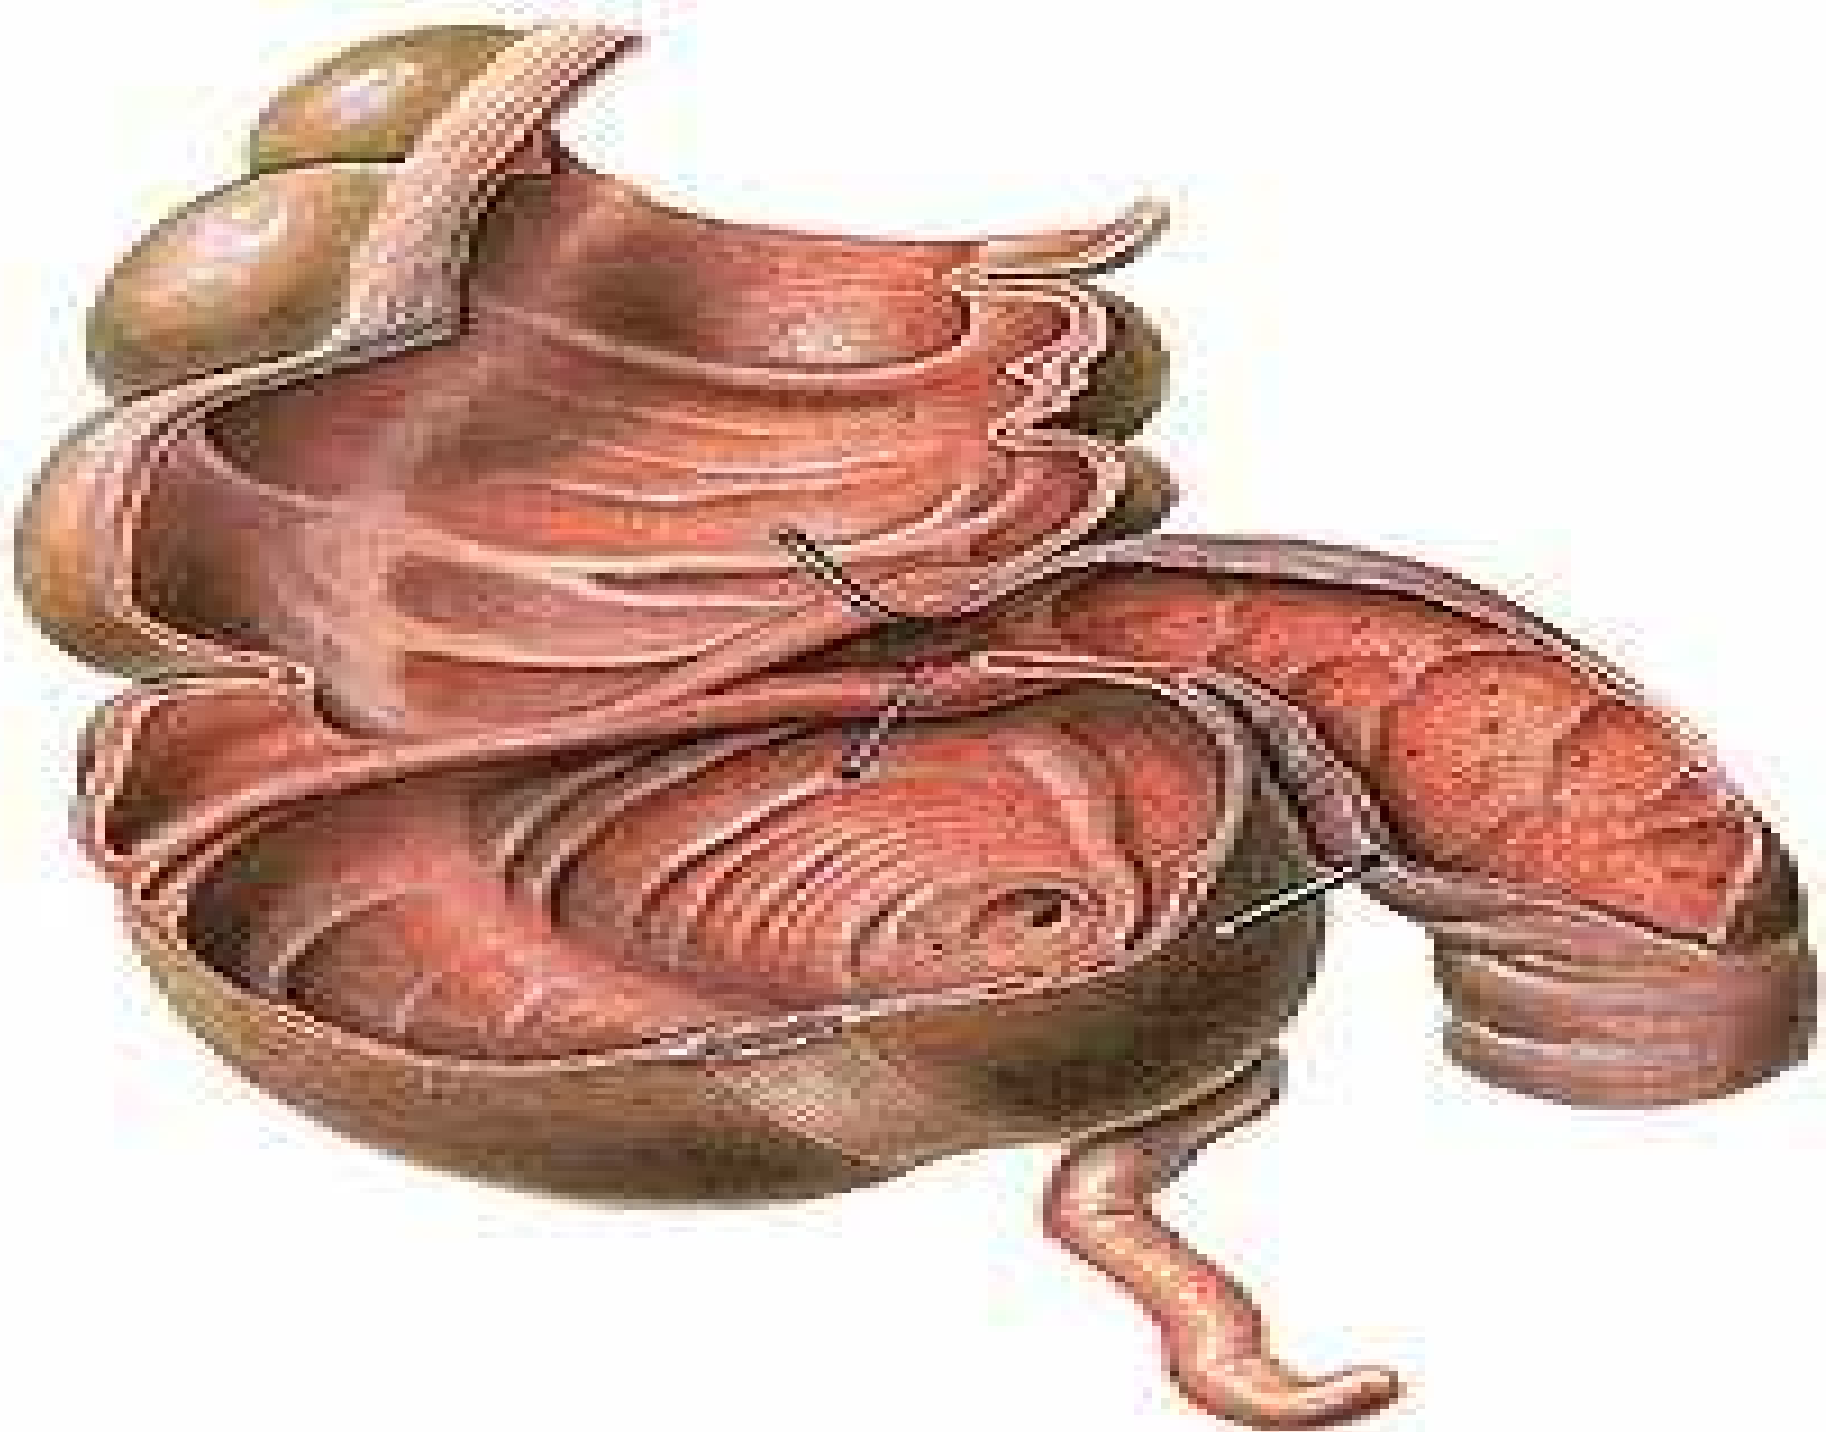

Peritoneal relation:

- 1) It completely covered with peritoneum.
- 2) The presence of peritoneal folds in the vicinity of the cecum creates the **superior ileocecal, inferior ileocecal, and retrocecal recesses**

Ileocecal Valve:

- The ileocecal valve consists of **2** horizontal folds of mucous membrane that project around orifice of ileum.
- The circular muscle of lower end of ileum called **ileocecal sphincter** serves as a sphincter & controls flow of contents from ileum into colon.
- The smooth muscle tone is reflexly increased when cecum is distended; the hormone **gastrin** which is produced by stomach causes relaxation of muscle tone.

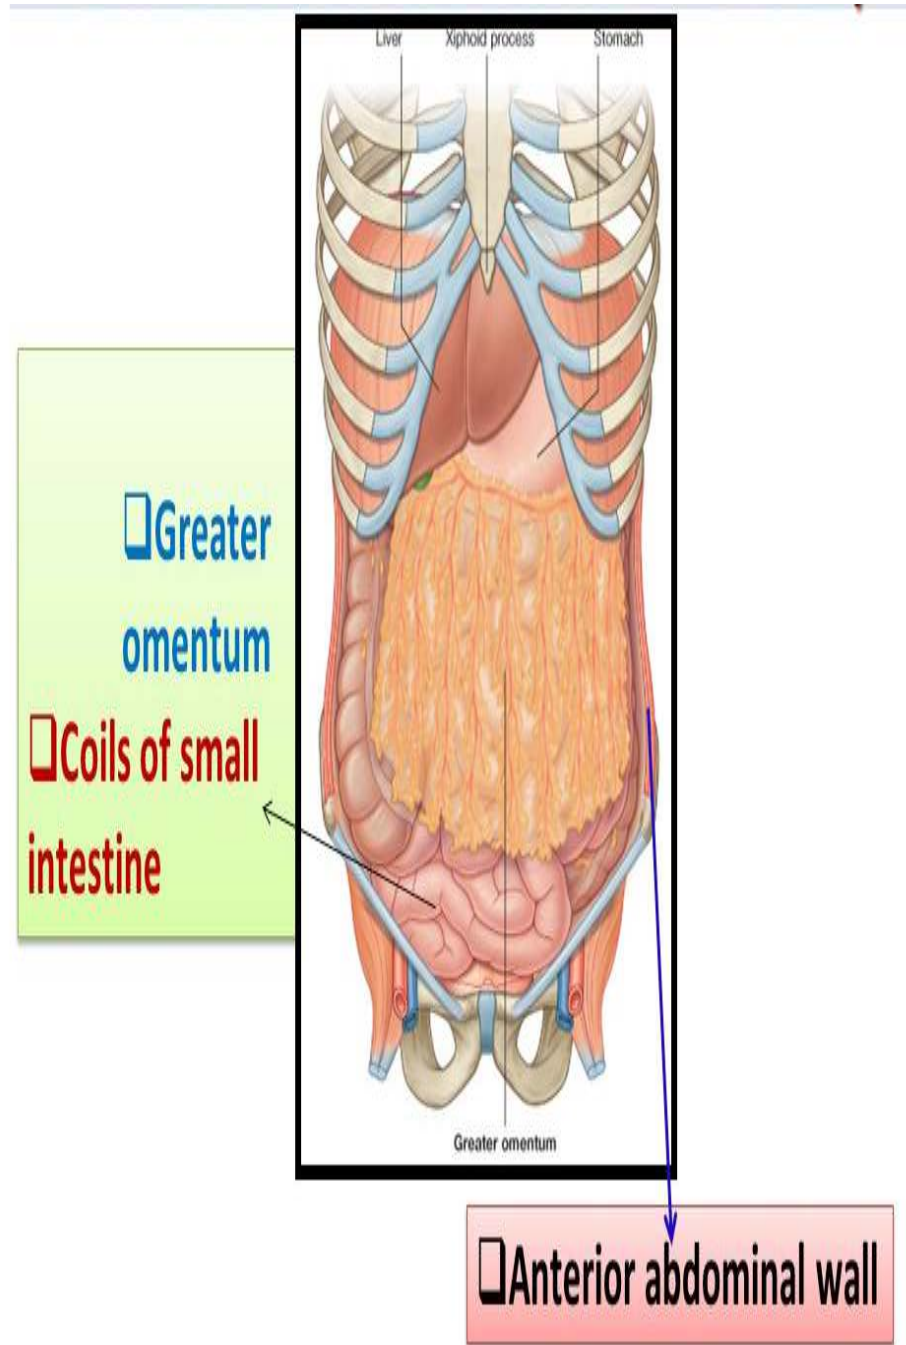

Relations:

Anteriorly: anterior abdominal wall, greater omentum & Coils of small intestine.

Posteriorly: The psoas & iliacus muscles, femoral nerve, lateral cutaneous nerve of thigh, appendix is **commonly** found behind Cecum.

Medially: The appendix origin.

Blood Supply:

Arteries:

Aorta ----- superior mesenteric artery-----ileocolic artery-----Anterior & posterior cecal arteries

Veins:

The veins correspond to arteries & drain into superior mesenteric vein--- portal vein.

Lymph Drainage:

superior mesenteric nodes.

Nerve Supply:

1) sympathetic .

2) parasympathetic (vagus)

nerves form the superior mesenteric plexus..
