

Mesozoic Life

Life of the Mesozoic Era

- Age of Reptiles
 - most diverse and abundant land dwellers
- Mammals appear
- Birds appear
- Flowering plants appear
- Some marine invertebrate groups recover Pm \ Tr
- Another big extinction at end K

Just before the Mesozoic: Permian \ Triassic Extinctions

- Many major Paleozoic groups extinct
- a) Trilobites
- b) Rugose and tabulate corals
- c) Blastoids
- d) Fusulinid foraminifera
- e) Brachiopods and crinoids severely reduced

TRILOBITES are always the most popular of Paleozoic fossils. They were most numerous and

Replacement radiations

- New marine groups assumed ecological roles of extinct organisms
- a) New corals and planktonic foraminifera
- b) Several classes of mollusks
 - Ammonites radiate
 - Clams replace many brachiopod groups
 - Rudistid clams become reef formers
- Marine Reptiles replace fish as top marine predators

Marine Reptiles

- Several groups of Triassic diapsid and euryapsid reptiles became successful marine predators
- They developed streamlined bodies
- Flipperlike modifications of limbs
- Large size

- Ichthyosaurs
- Mosasaurs

(a)

- Plesiosaurs

(b)

Mosasaurs - Marine Lizards

Placodonts

Ichthyosaurus

Univ. of Michigan Exhibit Museum of Natural History -- Life Through the Ages Diorama

THE SAUROPTERYGIA WERE MESOZOIC AQUATIC PADDLERS.

PLESIOSAURS, TRIASSIC THROUGH CRETACEOUS, WERE THE COMMONEST AND LARGEST OF THE GROUP. WITH THEIR WIDE FLATTENED BODY, PADDLE-LIKE LIMBS AND LONG NECK AND TAIL, THEY WERE MORE OR LESS LIKE MARINE TURTLES IN HABIT.

THE PLESIOSAUR LIMBS WERE USED AS OARS

A PLESIOSAUR SHALL GET LONGER-SHALLED PLESIOSAURS ARE BORN IN LARGER THAN THE SHORT-SHALLED FORMS

PLESIOSAUR BODIES WERE LARGER AND MORE POWERFUL THAN THE TURTLES

Plesiosaurus

Univ. of Michigan Exhibit Museum of Natural History

Top marine predators in Mesozoic, mostly ate fish and ammonites

Land Plants Gymnosperms

- Cycads

- Cylindrical trunks and large-fernlike leaves
- Dominant during Jurassic, common until Cretaceous

- Conifers

- most modern conifer types
- dominated Cretaceous forests as cycads declined

- Ginkgoes

- Common in Mesozoic forests
- Single surviving species like Mesozoic ancestors

Angiosperms - Flowering Plants

- Most significant Mesozoic evolutionary event
- Flower uses color and scent to encourage insect pollination
- Higher pollination success rates than gymnosperms that use wind
- Manufacture of seeds with a food supply
- Animals became important in distributing seeds from fruits

Mammal-Like reptiles

- Therapsid reptiles recovered from Permo-Triassic extinctions
- Cynodonts radiated in Early Triassic
- Gondwana carnivorous *Cynognathus* found in Africa and South America
- Herbivorous cynodonts lived until Middle Jurassic

Triassic Therapsids

Lystrosaurus

Thrinaxodon

Mesozoic Therapsids

Lystrosaurus

Origin of Mammals

- Therapsids gave rise to cynodonts, which evolved into the mammal class
 - skeletal structure is used to identify mammals in the fossil record
 - differences in the lower jaw and ear in particularly distinguish mammals

THE EVOLUTION OF EARS

Origin and Early History of Mammals

- Mammal diversity remained low throughout the Mesozoic
 - branches did develop however
 - monotremes
 - marsupial
 - placental

Eupantotheres ancestral to marsupials and placentals

humans

Roy Chapman Andrews

1884 - 1960

In the Gobi desert of
Mongolia, found the
first dinosaur nests
and evidence of
parental care in the
dinosaurs *Protoceratops*
Modern studies of
Dinosaurs still test
his theories

Discussion: *Oviraptor*

First dinosaur found
Iguanodon

Mary Anning

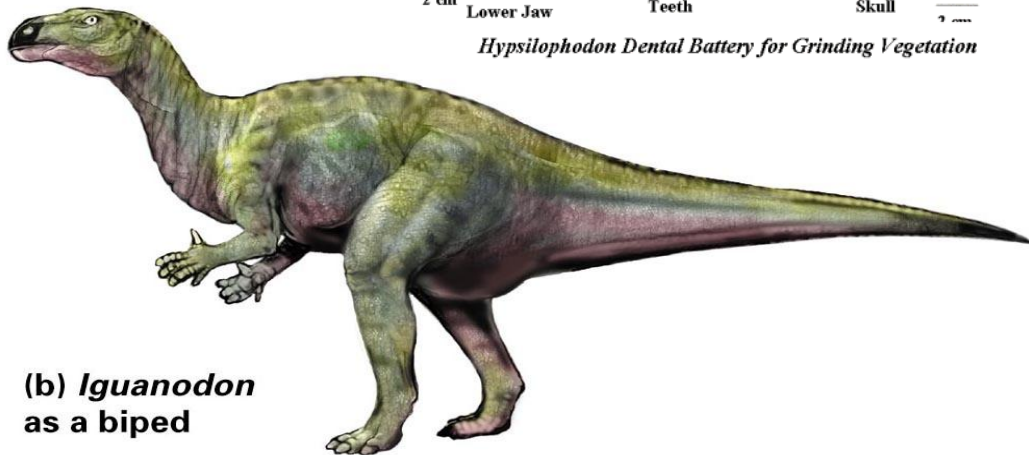

- First dinosaur discovered in 1822
- 1842 Richard Owen “dinosaur”
- Dinosaurs are terrestrial, so they are rare fossils

(a) *Iguanodon* as a quadruped

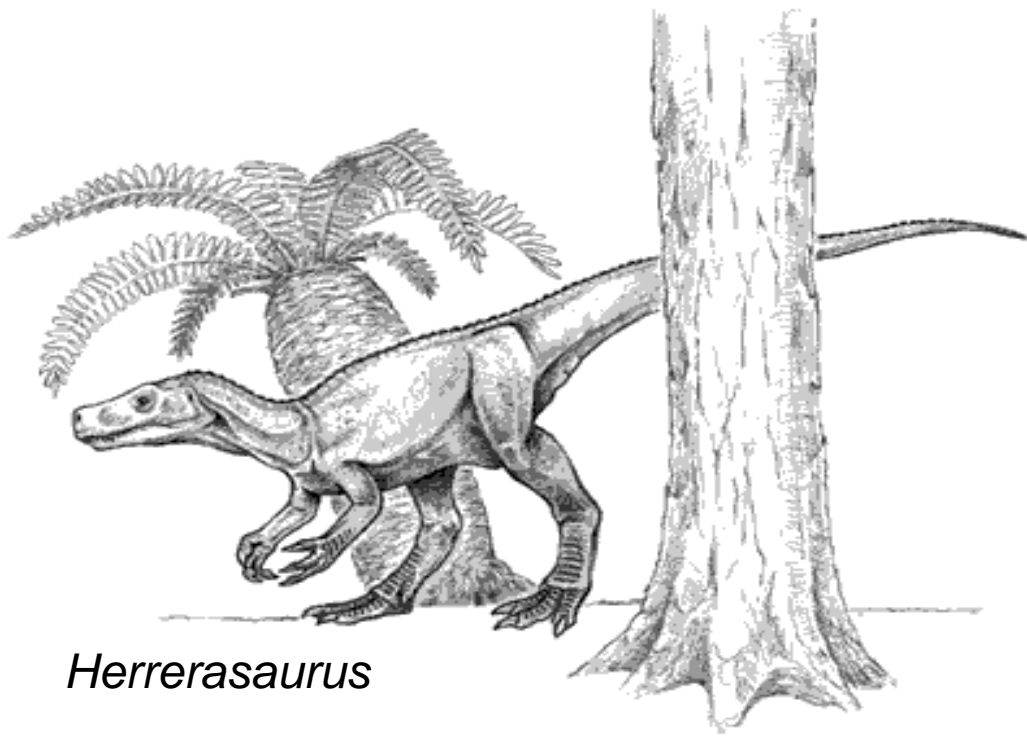

Hypsilophodon Dental Battery for Grinding Vegetation

(b) *Iguanodon* as a biped

Dinosaur Ancestry

- Archosaurs, reptiles that radiated in P_m and especially Early Triassic
- Small bipedal forms may have been ancestral to dinosaurs and birds

Herrerasaurus

Basal Archosaurs

Common fossil near campus

Phytosaurs

Rutiodon

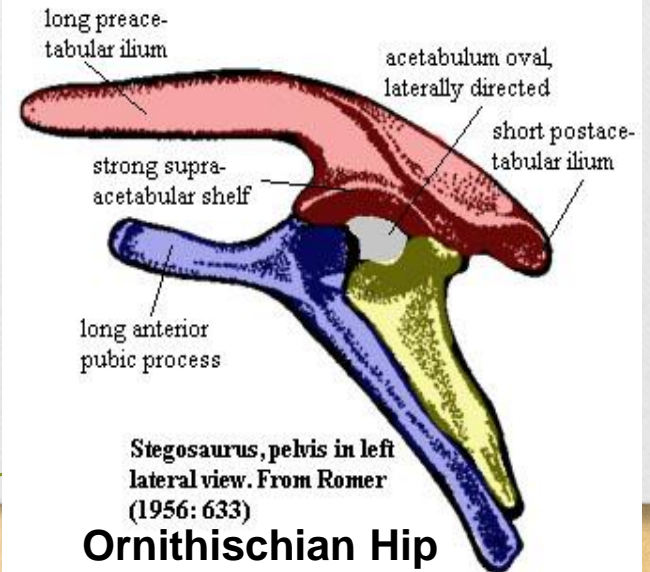

Archosaurs and the Origin of Dinosaurs

- Archosaurs gave rise to crocodiles, pterosaurs, dinosaurs, and birds

- Dinosaurs two groups distinguished by hips:

- Saurischia (lizard hip)
- Ornithischia (bird hip)

Saurischian Hip

Saurischians

Ornithischians

-  Ilium

Common ancestor

Dinosaurs

- Saurischians
 - theropods were bipedal carnivores
 - sauropods were the giant, quadrupedal herbivores
- Ornithischians
 - Ornithomimids (duckbill)
 - Pachycephalosaurs
 - Ankylosaurs
 - Stegosaurs
 - Ceratopsians

Saurischian Dinosaurs

- Theropods, the carnivorous dinosaurs

Seismosaurus

APATOSAURUS

"Deceptive lizard," named by Othniel C. Marsh, 1877. Also known as *Brontosaurus*, or "thunder lizard," named by Marsh in 1879. First found at Morrison, Colorado. Adult length, 70 to 75 feet. Estimated weight, 34 tons. Although this is one of the best-known of all dinosaurs, to both the public and scientists, it has never been found with a skull attached to its neck. The only known skull that probably belonged to it was found in the Dinosaur National Monument Quarry in the first years of excavation.

BAROSAURUS

"Heavy lizard," named by Othniel C. Marsh, 1890. First found in the Black Hills, South Dakota. Adult length, 70 to 80 feet. Estimated weight, 25 tons. Distinguished by very large neck bones. Skull is unknown.

CAMARASAURUS

"Chamber lizard," named by Edward D. Cope, 1877. First found at Garden Park, Colorado. Adult length, 35 to 60 tons. Two species known, one large, the other relatively small. This drawing represents a 17-foot-long juvenile of the smaller species. Its skeleton, from the Dinosaur National Monument Quarry, is the most complete sauropod skeleton ever found anywhere.

DIPLODOCUS

"Double beam," named by Othniel C. Marsh, 1878. First found at Garden Park, Colorado. Adult length, 75 to 85 feet. Estimated weight, 13 tons. One skeleton found in Wyoming measures nearly 90 feet, the longest dinosaur skeleton known.

Ornithischian Dinosaurs

- Stegosaurus (plate-backed dinosaurs)
- Ornithopods including Hadrosaurs (duckbills)
- Ankylosaurs (armored dinosaurs)
- Pachycephalosaurs (thick-headed dinosaurs)

Triceratops skull: left lateral view, showing various ceratopine characters

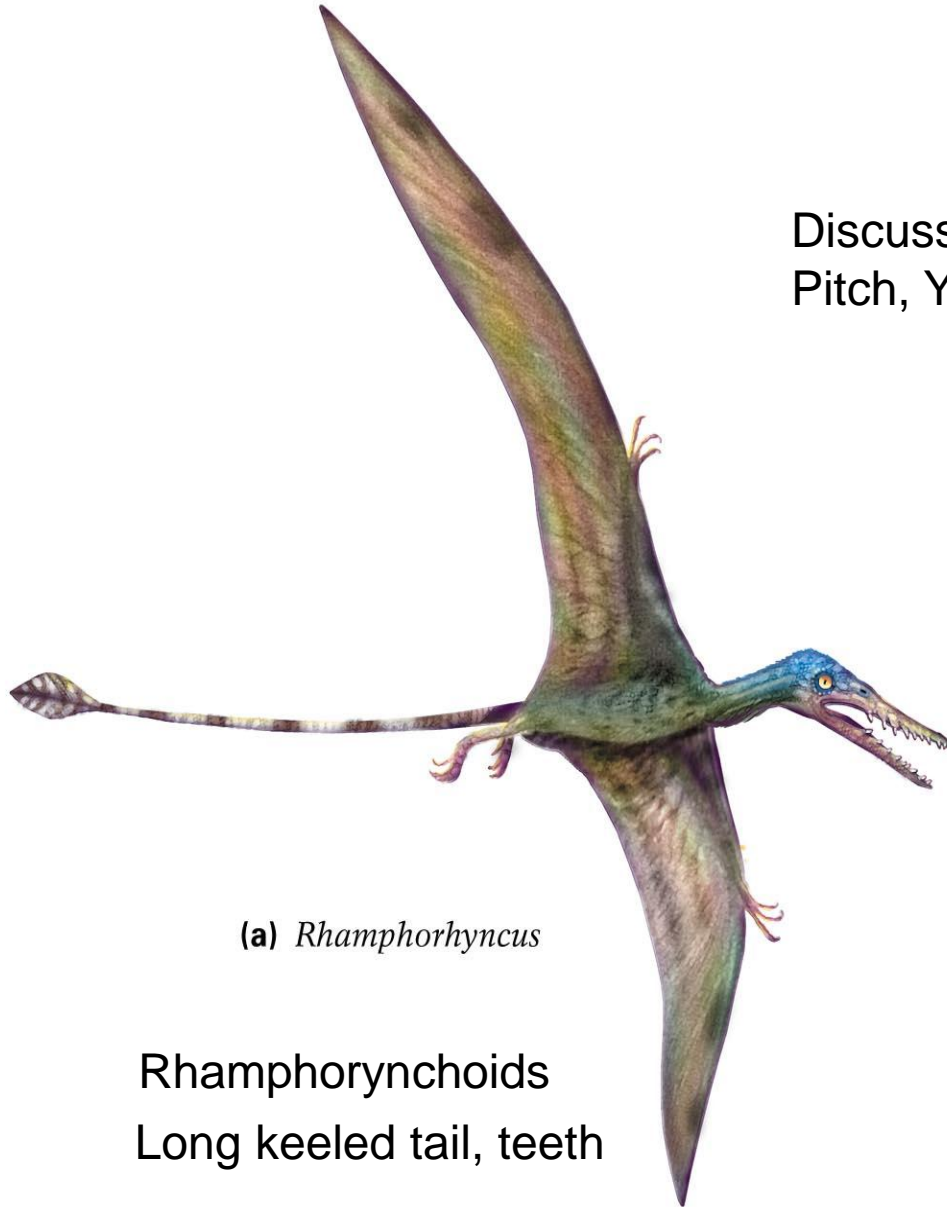

Flying Reptiles

- The pterosaurs were the first vertebrates to fly
 - common from Late Triassic to Cretaceous
 - wing membrane supported by an elongated fourth finger
 - light hollow bones
 - development of brain areas associated with coordination and sight
 - likely to have been endothermic

Principle pterosaur groups

Discussion: stability and steering in flight
Pitch, Yaw and Roll
