

# Calculations Used in Analytical Chemistry

## Some important units of measurement

### SI Units

The International System of Units (SI) is based on 7 fundamental base units.

Base quantity		SI base unit	
Name of base quantity	Symbol	Name of SI base unit	Symbol
length	<i>l, x, r, etc.</i>	<a href="#">metre</a>	m
mass	<i>m</i>	<a href="#">kilogram</a>	kg
time, duration	<i>t</i>	<a href="#">second</a>	s
electric current	<i>I, i</i>	<a href="#">ampere</a>	A
thermodynamic temperature	<i>T</i>	<a href="#">kelvin</a>	K
amount of substance	<i>n</i>	<a href="#">mole</a>	mol
luminous intensity	<i>I<sub>v</sub></i>	<a href="#">candela</a>	cd

The angstrom unit Å is a non-SI unit of length widely used to express the wavelength of very short radiation such as X-rays ( $1 \text{ Å} = 0.1 \text{ nm}$ ).

Thus, typical X-radiation lies in the range of 0.1 to 10 Å.

Metric units of kilograms (kg), grams (g), milligrams (mg), or micrograms ( $\mu\text{g}$ ) are used in the SI system.

Volumes of liquids are measured in units of liters (L), milliliters (mL), microliters ( $\mu\text{L}$ ), and sometimes Nano liters (nL).

The liter, the SI unit of volume, is defined as exactly  $10^{-3} \text{ m}^3$ . The milliliter is defined as  $10^{-6} \text{ m}^3$ , or  $1 \text{ cm}^3$ .

### **The Distinction Between Mass and Weight**

Mass is an invariant measure of the quantity of matter in an object.

1. Weight is the force of attraction between an object and its surroundings, principally the earth. Because gravitational attraction varies with geographical location, the weight of an object depends
2. Weight and mass are related by the familiar expression

$$w = mg$$

**w is the weight of an object,**

**m is its mass, and g is the acceleration due to gravity.**

## The Mole

- The mole (abbreviated mol) is the SI unit for the amount of a chemical substance.
- It is always associated with specific microscopic entities such as atoms, molecules, ions, electrons, other particles, or specified groups of such particles as represented by a chemical formula.
- It is the amount of the specified substance that contains the same number of particles as the number of carbon atoms in exactly 12 grams of  $^{12}\text{C}$ .
- This is Avogadro's number  $N_A = 6.022 \times 10^{23}$ .
- The molar mass  $M$  of a substance is the mass in grams of 1 mole of that substance.

**The number of moles  $n_X$  of a species  $X$  of molar mass  $M_X$  is given by:**

$$\text{Amount } X = n_X = m_X / M_X$$

The molar mass of glucose is:

$$M_X \text{ of } \text{C}_6\text{H}_{12}\text{O}_6 = \text{C}(6 \times 12) + \text{H}(12 \times 1) + \text{O}(6 \times 16) = \mathbf{180} \text{ gm/mol}$$

## The Millimole

**1 millimole = 1/1000 of a mole,**

**1 millimolar mass (mM) = 1/1000 of the molar mass.**

**1 mmol =  $10^{-3}$  mol, and  $10^3$  mmol = 1 mol**

**Example:**

Calculate the number of moles of aluminum present in (a) 108 g and (b) 13.5 g of the element. (Relative atomic mass: Al = 27).

**Solution:**

a-

$$\begin{aligned}\text{number of moles} &= \frac{\text{mass}}{\text{molar mass}} \\ &= \frac{108}{27} = 4 \text{ moles}\end{aligned}$$

b-

$$\begin{aligned}\text{number of moles} &= \frac{\text{mass}}{\text{molar mass}} \\ &= \frac{13.5}{27} = 0.5 \text{ moles}\end{aligned}$$

**Example:**

Calculate the number of moles of magnesium oxide, MgO in (a) 80 g and (b) 10 g of the compound. (Relative atomic mass: O = 16, Mg = 24)

**Solution:**

a) Mass of 1 mole of MgO

$$= (1 \times 24) + (1 \times 16)$$

$$= 40 \text{ g/mol}$$

a-

$$\text{number of moles} = \frac{\text{mass}}{\text{molar mass}}$$

$$= \frac{80}{40} = 2 \text{ moles}$$

b-

$$\text{number of moles} = \frac{\text{mass}}{\text{molar mass}}$$

$$= \frac{10}{40} = 0.25 \text{ moles}$$

### Example:

Calculate the mass of (a) 2 moles and (b) 0.25 moles of iron.  
(Relative atomic mass: Fe = 56)

### Solution:

$$\begin{aligned} \text{a) mass of 2 moles of iron} \\ &= \text{number of moles} \times \text{molar mass} \\ &= 2 \times 56 \\ &= 112 \text{ g} \end{aligned}$$

$$\begin{aligned} \text{b) mass of 0.25 mole of iron} \\ &= \text{number of moles} \times \text{molar mass} \\ &= 0.25 \times 56 \\ &= 14 \text{ g} \end{aligned}$$

### Calculation of moles by Avogadro number

Example: Calculate the number of moles of potassium in  $1.25 \times 10^{21}$  atoms K.

## Answer

$$1 \text{ mole} = 6.022 \times 10^{23}$$

$$X = 1.25 \times 10^{21}$$

$$X = 1 \text{ mole} \times 1.25 \times 10^{21} / 6.022 \times 10^{23}$$

$$X = 2.08 \times 10^{-3} \text{ mol K}$$

## Example

What is the mass in grams of  $2.01 \times 10^{22}$  atoms of sulfur?

## Example

How many O<sub>2</sub> molecules are present in 0.470 g of oxygen gas?

## Percent Composition of a Substance

### Practice Exercise

#### Example 1

EDTA (ethylenediaminetetraacetic acid) is used as a food preservative and in the treatment of metallic lead poisoning. Calculate the percent composition of EDTA,  $C_{10}H_{16}N_2O_8$

#### Answer

$$\begin{aligned}\text{Molecular weight of EDTA} &= C(10 \times 12) + H(16 \times 1) + N(2 \times 14) + O(8 \times 16) \\ &= 120 + 16 + 28 + 128 = 292 \text{ gm/mol}\end{aligned}$$

$$\%C = (10 \times 12 / 292) \times 100 = 41.09\%$$

$$\%H = (16 \times 1 / 292) \times 100 = 5.47\%$$

$$\%N = (2 \times 14 / 292) \times 100 = 9.58\%$$

$$\%O = (8 \times 16 / 292) \times 100 = 43.83\%$$

$$41.09 + 5.47 + 9.58 + 43.83 = 99.97$$

#### Example 2

If an analysis of sugar,  $C_xH_yO_z$ , gave 40.0% C and 6.7% H, what is the percent oxygen?

#### Answer

$$\%O = 100 - (40.0 + 6.7) = 53.3\%$$

## Empirical Formula from Mass Composition

### Example 1

In a laboratory experiment, 0.500 g of scandium was heated and allowed to react with oxygen from the air. The resulting product oxide had a mass of 0.767 g. Now, let's find the empirical formula for scandium oxide,  $\text{Sc}_x\text{O}_y$ . mass number: Sc=44.96 O=16

### Answer

The empirical formula is the simplest whole-number ratio of scandium and oxygen in the compound scandium oxide. This ratio is experimentally determined from the moles of each reactant. The moles of scandium are calculated as follows:

$$\text{mol of Sc} = 0.5/44.96 = 0.0111 \text{ mol Sc}$$

$$\text{weight of O} = 0.767 - 0.5 = 0.267 \text{ g}$$

$$\text{mol of O} = 0.267/16 = 0.0166 \text{ mol O}$$

$$\text{Sc} = 0.0111/0.0111 = 1$$

$$\text{O} = 0.0166/0.0111 = 1.5$$

### Example 2

Iron can react with chlorine gas to give two different compounds,  $\text{FeCl}_2$  and  $\text{FeCl}_3$ . If 0.558 g of metallic iron reacts with chlorine gas to yield 1.621 g of iron chloride, which iron compound is produced in the experiment? mass number: Fe=55.84 Cl=35.45

Answer

$$\text{mol of Fe} = 0.558/55.84 = 0.01 \text{ mol Fe}$$

$$\text{weight of Cl} = 1.621 - 0.558 = 1.063 \text{ g Cl}$$

$$\text{mol of Cl} = 1.063/35.45 = 0.03 \text{ mol Cl}$$

$$\text{Fe} = 0.01/0.01 = 1$$

$$\text{Cl} = 0.03/0.01 = 3$$

The compound is Fe Cl<sub>3</sub> (Ferric chloride)

## Molecular Formula from Empirical Formula

### Example 1

The empirical formula for fructose, or fruit sugar, is CH<sub>2</sub>O. If the molar mass of fructose is 180 g/mol, find the actual molecular formula for the sugar.

Answer

We can indicate the molecular formula of fructose as (CH<sub>2</sub>O)<sub>n</sub>. The molar mass of the empirical formula CH<sub>2</sub>O is 12 g C + 2(1 g H) + 16 g O = 30 g/mol. Thus, the number of multiples of the empirical formula is:

$$n = 180/30 = 6$$

Molecular formula of fructose is = 6 x (CH<sub>2</sub>O) = **C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>**

## Example 2

Ethylene dibromide was used as a grain pesticide until it was banned. Calculate (a) the empirical formula and (b) the molecular formula for ethylene dibromide given its approximate molar mass of 190 g/mol and its percent composition: 12.7% C, 2.1% H, and 85.1% Br.

mass number: Br=79.9

mol of C=  $12.7/12 = 1.05$  mol C

mol of H=  $2.1/1 = 2.1$  mol H

mol of Br=  $85.1/79.9 = 1.06$  mol Br

C=  $1.05/1.05 = 1$

H=  $2.1/1.05 = 2$

Br=  $1.06/1.05 = 1$

a) empirical formula = **C<sub>1</sub>H<sub>2</sub>Br<sub>1</sub>**

The molar mass of the empirical formula CH<sub>2</sub>Br =  
C(1x12)+H(2x1)+Br(1x79.9)= 93.9 g/mol

n=  $190/93.9 = 2$

b- molecular formula is = n (CH<sub>2</sub>Br)

= 2(CH<sub>2</sub>Br) = **C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub>**

# Solutions and their concentrations

## *Concentration of Solutions*

In this subject, we describe the four fundamental ways of expressing solution concentration:

- (1) molar concentration
- (2) percent concentration
- (3) normality concentration
- (4) p-functions.

### *(1) Molar Concentration*

The molar concentration  $c_x$  of a solution of a solute species X is the number of moles of that species that is contained in 1 liter of the solution (not 1 L of the solvent).

$$c_x = \frac{n_x}{V}$$

molar concentration =  $\frac{\text{no. moles solute}}{\text{volume in liters}}$

- \* The unit of molar concentration is molar, symbolized by M, which has the dimensions of mol/L, or mol L<sup>-1</sup>.
- \*\* Molar concentration is also the number of millimoles of solute per

milliliter of solution.

$$1 \text{ M} = 1 \text{ mol L}^{-1} = 1 \frac{\text{mol}}{\text{L}} = 1 \text{ mmol L}^{-1} = 1 \frac{\text{mmol}}{\text{L}}$$

**Example (1):** Calculate the molar concentration of ethanol in an aqueous solution that contains 2.30 g of  $\text{C}_2\text{H}_5\text{OH}$  (46.07 g/mol) in 3.50 L of solution.

**Solution:**

To obtain the molar concentration,  $c_{\text{C}_2\text{H}_5\text{OH}}$ , we divide the amount by the volume. Thus:

$$\begin{aligned} c_{\text{C}_2\text{H}_5\text{OH}} &= \frac{2.30 \text{ g C}_2\text{H}_5\text{OH} \times \frac{1 \text{ mol C}_2\text{H}_5\text{OH}}{46.07 \text{ g C}_2\text{H}_5\text{OH}}}{3.50 \text{ L}} \\ &= 0.0143 \text{ mol C}_2\text{H}_5\text{OH/L} = 0.0143 \text{ M} \end{aligned}$$

**Example (2):** Calculate the analytical molar concentrations of the solute species in an aqueous solution that contains 285 mg of trichloroacetic acid,  $\text{Cl}_3\text{CCOOH}$  (163.4 g/mol), in 10.0 mL.

**Solution:**

As in Example (1), we calculate the number of moles of  $\text{Cl}_3\text{CCOOH}$ , which we designate as HA, and divide by the volume of the solution, 10.0 mL, or 0.0100 L. Therefore:

$$\begin{aligned} \text{amount HA} = n_{\text{HA}} &= 285 \text{ mg HA} \times \frac{1 \text{ g HA}}{1000 \text{ mg HA}} \times \frac{1 \text{ mol HA}}{163.4 \text{ g HA}} \\ &= 1.744 \times 10^{-3} \text{ mol HA} \end{aligned}$$

The molar analytical concentration,  $c_{\text{HA}}$ , is then:

$$c_{\text{HA}} = \frac{1.744 \times 10^{-3} \text{ mol HA}}{10.0 \text{ mL}} \times \frac{1000 \text{ mL}}{1 \text{ L}} = 0.174 \frac{\text{mol HA}}{\text{L}} = 0.174 \text{ M}$$

$$W \text{ in gm} = 285 / 1000 = 0.285 \text{ g}$$

$$M = (W/MW) \times (1000 / V \text{ in ml})$$

$$M = (0.285 / 163.4) \times (1000 / 10)$$

$$M = 0.00174 \times 100 = 0.174 \text{ molar}$$
