** Chemists frequently express concentrations in terms of percent (parts per hundred).

Three common methods are:

## PERCENT BY MASS

## Example

What is the percent by mass of a solution that contains 26.5 g of glucose in 500 g of solution?

## Solution

$$
\% \mathrm{w} / \mathrm{w}=(26.5 / 500) \mathrm{x} 100=53 \%
$$

## PERCENT BY VOLUME

## Example

How would you prepare 250 mL of $70 \%(\mathrm{v} / \mathrm{v})$ of rubbing alcohol?
Solution
$\% \mathrm{v} / \mathrm{v}=(\mathrm{v} / \mathrm{v}) \times 100$
$70=(\mathrm{v} / 250) \times 100$
$100 \mathrm{v}=70 \times 250$
$\mathrm{V}=70 \times 250 / 100=175 \mathrm{ml}$

## PERCENT BY MASS OVER VOLUME (m/v)

## Example

If the density of 500 g solution is $0.857 \mathrm{~g} / \mathrm{mL}$, what is the percent $(\mathrm{m} / \mathrm{v})$ of 275 g rubbing alcohol?

Solution:
D $=\mathrm{w} / \mathrm{v}$
$0.857=500 / \mathrm{v}$
$\mathrm{V}=500 / 0.857=583.4 \mathrm{ml}$ of solution
$\% \mathrm{w} / \mathrm{v}=(275 / 583.4) \times 100=47.13 \%$

## Normality concentration

As per the standard definition, normality is described as the number of gram or mole equivalents of solute present in one liter of a solution.

- Normality $(N)=$ Number of gram equivalents $\times$ [volume of solution in liters] ${ }^{-1}$

How can calculate the gram equivalents?

## 1- gram equivalent of acid

Eq. wt= Molecular weight of acid $/$ no. of $\mathrm{H}^{+}$

Ex. Eq. wt of HCl
$\mathrm{HCl}-----------\mathrm{H}^{+}+\mathrm{Cl}^{-} \quad \mathrm{H}_{3} \mathrm{PO}_{4}------------3 \mathrm{H}^{+}+\mathrm{PO}_{4}^{-3}$
Eq. wt of $\mathrm{HCl}=36.5 / 1=36.5 \quad \mathrm{CH}_{3} \mathrm{COOH}-----------\quad \mathrm{H}^{+}+\mathrm{CH}_{3} \mathrm{COO}^{-}$
Ex. Eq. wt of $\mathrm{H}_{2} \mathrm{SO}_{4}$
$\mathrm{H}_{2} \mathrm{SO}_{4}$--------------- $2 \mathrm{H}^{+}+\mathrm{SO}_{4}^{-2}$
Eq. wt of $\mathrm{H}_{2} \mathrm{SO}_{4}=98 / 2=49$

## 2- gram equivalent of base

Eq. wt= Molecular weight of base / no. of $\mathrm{OH}^{-}$
Ex. Eq. wt of NaOH
NaOH ------------ $\mathrm{Na}^{+}+\mathrm{OH}^{-}$
Eq. wt of $\mathrm{NaOH}=40 / 1=40$
Ex. Eq. wt of $\mathrm{Ca}(\mathrm{OH})_{2}$
$\mathrm{Ca}(\mathrm{OH})_{2}$------------ $\mathrm{Ca}^{+2}+2 \mathrm{OH}^{-}$
Eq. wt of $\mathrm{Ca}(\mathrm{OH})_{2}=74 / 2=37$
$\mathrm{Al}(\mathrm{OH})_{3}------\mathrm{Al}^{+3}+3 \mathrm{OH}^{-}$

## 2- gram equivalent of salt

Eq. wt= Molecular weight of salt / no. of metal $x$ oxidation no. of metal
Ex. Eq. wt of NaCl
Eq. wt of $\mathrm{NaCl}=58.5 / 1 \times 1=58.5$
Ex. Eq. wt of $\mathrm{Na}_{2} \mathrm{CO}_{3}$
$\mathrm{CaCO}_{3}$
Eq. wt of $\mathrm{Na}_{2} \mathrm{CO}_{3}=106 / 2 \times 1=53$

## Example 1.

Calculate the normality of 0.321 g sodium carbonate when it is mixed in a 250 mL solution.

Solution
$\mathrm{N}=$ no. of eq.mol $/ \mathrm{v}$ of solution in litre
$=(\mathrm{w} / \mathrm{eq} \mathrm{wt}) \times(1000 / \mathrm{v}$ in ml $) \quad$ eq wt of $\mathrm{Na}_{2} \mathrm{CO}_{3}=106 / 2 \times 1=53$
$\mathrm{N}=(0.321 / 53) \mathrm{x}(1000 / 250)$
$\mathrm{N}=0.024 \mathrm{~N} \mathrm{Na}_{2} \mathrm{CO}_{3}$
$\mathrm{M}=$

Exampe 2 . What is the normality of the following?

- 0.1381 M NaOH sol. $\mathrm{N}=0.1381 \mathrm{~N}$
- $0.0521 \mathrm{M} \mathrm{H}_{3} \mathrm{PO}_{4}$ sol. Eq. wt. of $\mathrm{H}_{3} \mathrm{PO}_{4}=1 / 3 \mathrm{Mwt}$
- 

$\mathrm{N}=3 \mathrm{xM}$

$$
\mathrm{N}=3 \mathrm{x} 0.0521=0.1563 \mathrm{~N}
$$

$0.015 \mathrm{M} \mathrm{Ca} \mathrm{CO}_{3} \quad \mathrm{Eq} . \mathrm{wt}$ of $\mathrm{CaCO}_{3}=100 / 1 \mathrm{x} 2=50$

$$
\mathrm{N}=2 \times 0.015=0.03 \mathrm{~N}
$$

## Acids and Bases

## Concepts

A compound is classified as an acid or a base based on certain properties. At present there are several theories which define the concepts of acidity and basicity. Some important concepts are detailed below:

## Arrhenius concept of acids and bases:

The Arrhenius definition of acids says that they are compounds that give off $\mathrm{H}^{+}$ions in water and that bases are compounds that give off $\mathrm{OH}^{-}$ions in water. Thus, according to this theory only protic acids are allowed and only hydroxide bases are allowed to be classified as an acid or a base.

$$
\begin{aligned}
& \mathrm{H}_{2} \mathrm{SO}_{4} \text {-------------- } \quad \mathrm{H}^{+}(\mathrm{aq})+\mathrm{HSO}_{4}^{-}(\mathrm{aq}) \\
& \mathrm{HSO}_{4}^{-}--------\mathrm{H}^{+}+\mathrm{SO}_{4}^{-2}
\end{aligned}
$$

## Bronsted-Lowry definition:

The Bronsted-Lowry definition of acids is that acids are compounds that give off $\mathrm{H}^{+}$ions when they react with another compound. Likewise, this definition says that bases are compounds that accept $\mathrm{H}^{+}$ions from other compounds. Furthermore, it also brings a new concept of conjugate acids and conjugate bases. Since an acid after donating its proton is technically a base according to this definition and is referred to as a conjugate acid. So every acid has its conjugate base and vice versa. Also, the stronger is an acid, the weaker is its conjugate base and vice versa.

| $\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O}$ | $+\cdots \mathrm{H}_{3} \mathrm{O}^{+}$ | $+\cdots \mathrm{HSO}_{4}^{-}$ |
| :--- | :--- | :--- |
| Acid | Base | Conjugate acid |

## Lewis concept of acids and bases:

Acids are electron pair acceptors while bases are electron pair donors. Thus, electron deficient species like $\mathrm{BF}_{3}$ are Lewis acids while electron rich species such as tertiary amines are Lewis bases. Lewis acids may combine with Lewis bases to generate a salt.

## $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{~N}:+\mathrm{BF}_{3} \quad----------\left(\mathrm{CH}_{3}\right)_{3} \mathrm{NBF}_{3}$

Lewis base Lewis acid

## pH and pOH

Hydronium and hydroxide ions are present both in pure water and in all aqueous solutions, and their concentrations are inversely proportional as determined by the ion product of water (Kw). The concentrations of these ions in a solution are often critical determinants of the solution's properties and the chemical behaviors of its other solutes. A solution is neutral if it contains equal concentrations of hydronium and hydroxide ions; acidic if it contains a greater concentration of hydronium ions than
hydroxide ions; and basic if it contains a lesser concentration of hydronium.

A common means of expressing quantities, the values of which may span many orders of magnitude, is to use a logarithmic scale. One such scale that is very popular for chemical concentrations and equilibrium constants is based on the p -function, defined as shown where " X " is the quantity of interest and "log" is the base-10 logarithm.

$$
\mathrm{pX}=-\log X
$$

The pH of a solution is therefore defined as shown here, where $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$is the molar concentration of hydronium ion in the solution:

$$
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]
$$

Rearranging this equation to isolate the hydronium ion molarity yields the equivalent expression:

$$
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10^{-\mathrm{pH}}
$$

Likewise, the hydroxide ion molarity may be expressed as a p-function, or pOH:

$$
\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]
$$

or

$$
\left[\mathrm{OH}^{-}\right]=10^{-\mathrm{pOH}}
$$

Finally, the relation between these two ion concentration expressed as p-functions is easily derived from the $K_{w}$ expression:

$$
\begin{gathered}
K_{\mathrm{w}}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right] \\
-\log K_{\mathrm{w}}=-\log \left(\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]\right)=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]+-\log \left[\mathrm{OH}^{-}\right] \\
\mathrm{p} K_{\mathrm{w}}=\mathrm{pH}+\mathrm{pOH}
\end{gathered}
$$

At $25^{\circ} \mathrm{C}$, the value of $K_{w}$ is $1.0 \times 10-14$, and so:

$$
14.00=\mathrm{pH}+\mathrm{pOH}
$$

As we learned earlier, the hydronium ion molarity in pure water (or any neutral solution) is $1.0 \times 10^{-7} \mathrm{M}$ at $25^{\circ} \mathrm{C}$. The pH and pOH of a neutral solution at this temperature are therefore:

$$
\begin{aligned}
& \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log \left(1.0 \times 10^{-7}\right)=7.00 \\
& \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]=-\log \left(1.0 \times 10^{-7}\right)=7.00
\end{aligned}
$$

## Summary of Relations for Acidic, Basic and Neutral Solutions

Classification
acidic
neutral
basic

Relative Ion Concentrations
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]>\left[\mathrm{OH}^{-}\right]$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{-}\right]$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]<\left[\mathrm{OH}^{-}\right]$

| $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right](\mathrm{M})$ | $\left[\mathrm{OH}^{-}\right](\mathrm{M})$ | pH | pOH |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $10^{1}$ | $10^{-15}$ | -1 | 15 |  |  |
| $10^{0}$ or 1 | $10^{-14}$ | 0 | 14 |  | acidic |
| $10^{-1}$ | $10^{-13}$ | 1 | 13 |  |  |
| $10^{-2}$ | $10^{-12}$ | 2 | 12 |  |  |
| $10^{-3}$ | $10^{-11}$ | 3 | 11 |  |  |
| $10^{-4}$ | $10^{-10}$ | 4 | 10 |  |  |
| $10^{-5}$ | $10^{-9}$ | 5 | 9 |  |  |
| $10^{-6}$ | $10^{-8}$ | 6 | 8 |  |  |
| $10^{-7}$ | $10^{-7}$ | 7 | 7 |  | neutr |
| $10^{-8}$ | $10^{-6}$ | 8 | 6 |  |  |
| $10^{-9}$ | $10^{-5}$ | 9 | 5 |  |  |
| $10^{-10}$ | $10^{-4}$ | 10 | 4 |  |  |
| $10^{-11}$ | $10^{-3}$ | 11 | 3 |  |  |
| $10^{-12}$ | $10^{-2}$ | 12 | 2 |  |  |
| $10^{-13}$ | $10^{-1}$ | 13 | 1 |  |  |
| $10^{-14}$ | $10^{0}$ or 1 | 14 | 0 |  | basi |
| $10^{-15}$ | $10^{1}$ | 15 | -1 |  |  |

## EXAMPLE 1: CALCULATION OF PH

1- What is the pH of stomach acid, a solution of HCl with a hydronium ion concentration of 0.1 M ?

Solution:
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=-\log 0.1=-\log 10^{-1}=1$
$\mathrm{pOH}=14-1=13$

2- What is the pH of a solution of $\mathrm{H}_{2} \mathrm{SO}_{4}$ with a hydronium ion concentration of $1.2 \times 10^{-3} \mathrm{M}$ ?
Solution:
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
$=-\log \left(1.2 \times 10^{-3}\right)$
$=-(-2.92)=2.92$
$\mathrm{pOH}=14-2.29=11.71$

3- Calculate the hydronium ion concentration of blood, the pH of which is 7.3 (slightly alkaline).

Solution:
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=10^{-\mathrm{pH}}$
$\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=5.01 \times 10^{-8}$

## CALCULATION OF POH

1- What are the pOH and the pH of a $0.0125-\mathrm{M}$ solution of potassium hydroxide, KOH ?
Solution:
KOH --------- $\mathrm{K}^{+}+\mathrm{OH}^{-}$
$\mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right]$
$\mathrm{pOH}=-\log 0.0125=1.9$
$\mathrm{pH}=14-1.9=12.1$

2- The hydronium ion concentration of vinegar is approximately $4 \times 10^{-3} \mathrm{M}$.
What are the corresponding values of pOH and pH ?
Solution:
$\mathrm{CH}_{3} \mathrm{COOH}$-------------- $\mathrm{CH}_{3 \mathrm{COO}}{ }^{-} \mathrm{H}^{+}$
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=-\log 4 \times 10^{-3}=2.39$
$\mathrm{pOH}=14-2.39=11.61$
