## Vectors (Applications 1)

## Example: Find the plane through $\mathbf{P}_{0}(2,4,5)$

 perpendicular to the line;$\mathrm{x}=5+\mathrm{t}, \mathrm{y}=1+3 \mathrm{t}, \mathrm{z}=4 \mathrm{t}$

## Solution:

The line $\mathrm{x}=5+\mathrm{t}, \mathrm{y}=1+3 \mathrm{t}, \mathrm{z}=4 \mathrm{t}$ has a vector $\mathrm{v}=\mathrm{i}+3 \mathrm{j}+4 \mathrm{k}$

The line vector is parallel to the same line.
The required plane is perpendicular to the given line.
Therefore, it is perpendicular to its vector.

The standard equation of the plane is;
$n 1(x-x 1)+n 2(y-y 1)+n 3(z-z 1)=0$
Where;
$(x 1, y 1, z 1)$ a point in the plane. In this problem we have $\operatorname{Po}(2,4,5)$ $\mathrm{n} 1, \mathrm{n} 2$ and n 3 are coefficient of the normal vector

Normal vector
$\mathrm{v}=\mathrm{n} 1 \mathrm{i}+\mathrm{n} 2 \mathrm{j}+\mathrm{n} 3 \mathrm{k}$
Then,
$(x-2)+3(y-4)+4(z-5)=0$
$x-2+3 y-12+4 z-20=0$
$x-3 y+4 z=34$

Example: Find the plane containing the intersecting lines.
$\mathbf{L} 1: \mathbf{x}=-\mathbf{1}+\mathbf{t}, \mathbf{y}=\mathbf{2}+\mathbf{t}, \mathbf{z}=\mathbf{1}-\mathbf{t} ;-\infty<t<\infty$
L2: $\mathbf{x}=1-4 \mathrm{~s}, \mathrm{y}=1+2 \mathrm{~s}, \mathbf{z}=2-2 \mathrm{~s} ;-\infty<s<\infty$
Solution:
L1 has a vector $\mathrm{u}=\mathrm{i}+\mathrm{j}-\mathrm{k}$
L 2 has a vector $\mathrm{v}=-4 \mathrm{i}+2 \mathrm{j}-2 \mathrm{k}$
$\mathrm{n}=\mathrm{u} \times \mathrm{v}=\left|\begin{array}{ccc}i & j & k \\ 1 & 1 & -1 \\ -4 & 2 & -2\end{array}\right|=6 \mathrm{j}+6 \mathrm{k}$

Choose any of the points from either L1 or L2
Use ( $-1,2,1$ ) from L1

The standard equation of the plane is;
$\mathrm{n} 1(\mathrm{x}-\mathrm{x} 1)+\mathrm{n} 2(\mathrm{y}-\mathrm{y} 1)+\mathrm{n} 3(\mathrm{z}-\mathrm{z} 1)=0$
Then
$0(x+1)+6(y-2)+6(z-1)=0$
$6 y-12+6 z-6=0$
$6 y+6 z=18$
$y+z=3$

## Example: Find the distance from the plane $x+2 y+6 z=1$ to the plane $x+2 y+6 z=10$.

Solution:
Distance between point and plane $=\left|\overrightarrow{P S} \cdot \frac{n}{|n|}\right|$
$P$ point in the plane
$S$ the point that required to find its distance from the plane.
n the normal vector to the plane
Select $P$ from the first plane by setting $y=0$ and $z=0$ then $x=1$ yields $\mathrm{P}(1,0,0)$
$\mathrm{n}=\mathrm{i}+2 \mathrm{j}+6 \mathrm{k}$ (normal to the first plane)

Select $S$ from the second plane by setting $y=0$ and $z=0$ then $x=10$ yields $S(10,0,0)$
$\overrightarrow{P S}=9 \mathrm{i}$
$\mathrm{D}=\left|\overrightarrow{P S} \cdot \frac{n}{|n|}\right|==\left|9 i \cdot \frac{i+2 j+6 k}{\sqrt{41}}\right|=\frac{9}{\sqrt{41}}$
