## Virtual Memory

- ◆ **Virtual memory** is the ability of the computer system to use a portion of the hard disk as if it were physical RAM.

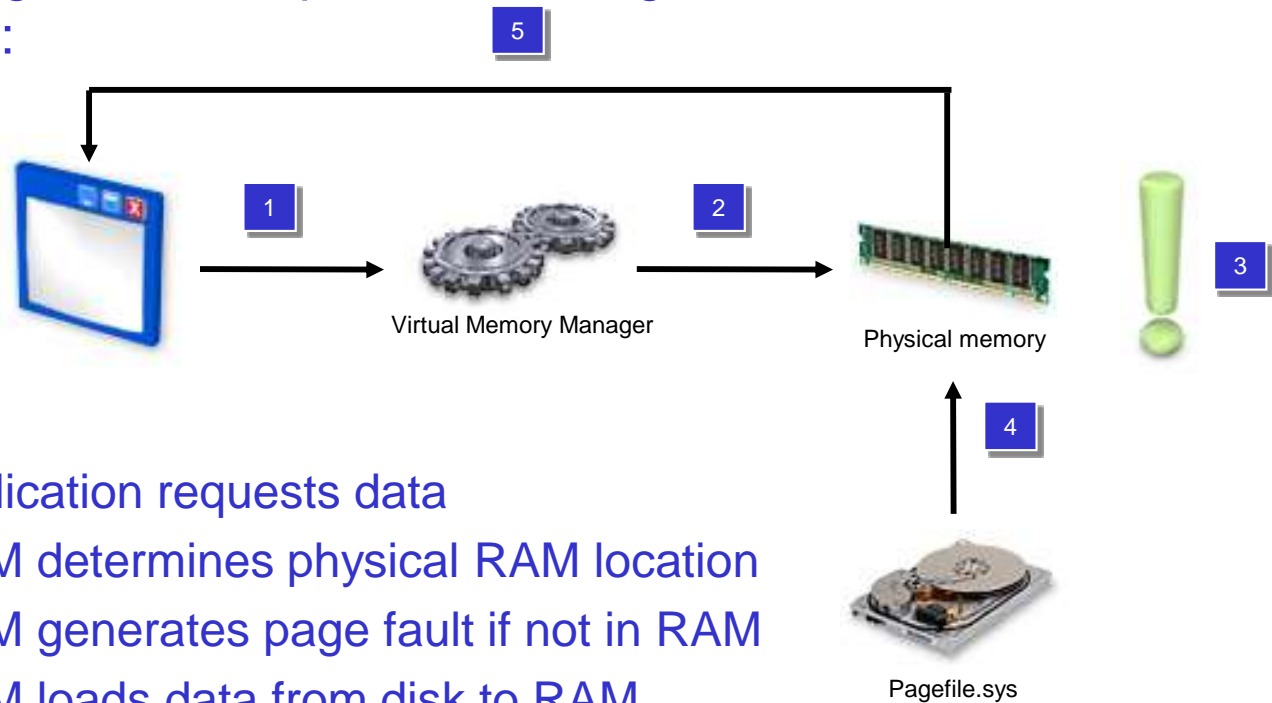

## The Virtual Memory Process

- ◆ Following are the steps to store data in virtual memory:
  1. Application requests memory
  2. VMM assigns memory page
  3. Application stores data
  4. VMM maps to physical RAM
  5. VMM moves data to pagefile when RAM full

## The Virtual Memory Process (Contd..)

- ◆ Following are the steps for retrieving data from virtual memory:

1. Application requests data
2. VMM determines physical RAM location
3. VMM generates page fault if not in RAM
4. VMM loads data from disk to RAM
5. Application retrieves data

## Windows Services

- ◆ A **Windows service** is a background process that performs a specific operation.
- ◆ Startup type of Windows services can be:
  - ◆ Automatic
  - ◆ Manual
  - ◆ Disable
