# Neutralization

### In general: Acid + Base $\rightarrow$ Salt + Water

## Salt Solutions

• When salts dissolve, their ions can recombine with water

# Salt Solutions $A^{-} + H_2 \longrightarrow HA + OH^{-}$

 $B^+ + H_2O \iff H^+ + BOH$ 

Salt Hydrolysis

To determine if a salt will form an acidic or basic solution, remember the following rules:

**Strong acid + Strong base** 

 $\rightarrow$  Neutral solution

Strong acid + Weak base

 $\rightarrow$  **Acidic** solution

Weak acid + Strong base

 $\rightarrow$  **Basic** solution

## Acid-Base Properties of Salt Solutions

- Salt solutions are affected by *salt hydrolysis,* in which ions produced by the dissociation of a salt react with water to produce either hydroxide ions or hydronium ions—thus impacting pH.
- *Basic salt solutions* an anion that is the strong conjugate base of a weak acid reacts with water to produce hydroxide ion.

 $A^{-}(aq) + H_2O(l) \Longrightarrow HA(aq) + OH^{-}(aq)$ 

- Neutral salt solutions
  - A salt composed of the cation of a strong base and the anion of a strong acid produces a neutral solution.
  - These ions do not hydrolyze in water.

For example:

NaCl or KNO<sub>3</sub>

- Acidic salt solutions
  - When the cation of a salt is the strong conjugate acid of a weak base, a solution of the salt will be acidic.

For example:

 $NH_4^+(aq) + H_2O(l) \Longrightarrow NH_3(aq) + H_3O^+(aq)$ 

# Salts That Produce Neutral Solutions

Salts of strong acids/strong bases *Example* – solution of MgBr<sub>2</sub>, salt of strong acid + strong base 2HBr (aq) + Mg(OH)<sub>2 (aq)</sub>  $\rightarrow$  2 H<sub>2</sub>O (1) + MgBr<sub>2 (aq)</sub> formation  $MgBr_{2(aq)} \rightarrow Mg^{2+}_{(aq)} + 2 Br_{(aq)}$ dissolution Weak conjugate  $\longrightarrow$  Mg<sup>+2</sup> (aq) + (20)No reaction base Weak conjugate  $Br_{(aq)} + K_2 O \rightarrow$ No reaction base of strong acid Weak conjugate acid and base do not hydrolyze (do not react with water)  $\Rightarrow$  pH = 7

#### **Hydrolysis of Salts**

Salts can be acidic, basic, or neutral.

#### 1. Neutral Salts

Consider NaCl

The **neutralization equation** used to produce **NaCl** will tell us what kind of salt it is.

HCl +NaOH $\rightarrow$ NaCl +HOHstrong acidstrong baseneutral salt

When the **acid** and **base** parents are both **strong** the salt is always **neutral**.

A neutral salt will dissociate in water.

## $NaCl \rightarrow Na^{+} + \mathcal{L}^{-}$ no ions to hydrolyze- neutral

Cross off the **both ions** that come from **strong parents** as they do not hydrolyze or react further with water- they are **neutral**.
