# Assay of citric acid 

## Prepared by:

Assist. lecturar: Mustafa Mohammed Hussein Al-Hakiem

- B.Sc. Pharmacy 2013.
- M.Sc. Pharmaceutical Chemistry 2020.
-E. Mail:mustafa.hashim@uobasrah.edu.iq

## Introduction:

- Citric acid $\left(\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{7}, \mathbf{m} . \mathbf{w t} .=192.123\right)$ is a white crystalline powder (or colorless crystals).

- It is very soluble in water and freely soluble in alcohol.
- It is a tri-basic acid, so its solutions are strongly acidic.

- It is available as the anhydrous form or monohydrate form. Assay of citric acid is based on the anhydrous

Structure of citric acid form.

## Chemical principle:

$>$ Since citric acid has strong acid properties, it is titrated against a standard basic solution like 1 N NaOH solution in an acid- base reaction.

Citric acid Sodium hydroxide

Sodium citrate
water
Reaction between citric acid and sodium hydroxide solution

## Uses of citric acid:

## Uses in medicine and pharmacy:

$>$ Citric acid is used widely in effervescent salts, for their effervescence on $\mathrm{CO}_{2}$ produced from the reaction between citric acid and sodium bicarbonate
$>$ Citric acid is also used to dissolve renal stones.
$>$ Sodium citrate used in blood transfusion and bacteriology for the prevention of blood clotting.

## EFFERVESCENT POW/DER

## Relief from painful

burning symptoms of urinary tract infections

URINARY ALKALINIZER
Each 4 g sachet contains: sodium bicarbonate 1.76 g tartieric scid a90 mg, sitric acid anhydrous 720 mg sodium citrate antrydrous 630 mg

AUSTR Z9GB3
8 sachets

## Uses of citric acid:

## Uses in the food industry:

$>$ Used as acidulant in the manufacture of jellies, jams, sweet and soft drinks
$>$ It is used for artificial flavoring in various foods
$>$ Sodium citrate is employed in processed cheese manufacture

## Uses of citric acid:

## Uses in the cosmetic industry:

$>$ It is used in astringent lotions such as aftershave lotion because of its low PH
$>$ Citric acid is used in hair rinses and hair and wig setting fluids.

## Procedure:

$>$ Weigh accurately ( 12.5 g ) of citric acid and dissolve it in (1L )of distilled water.
$>$ and then take (3ml) of citric acid and titrate with $(0.25 \mathrm{~N})$ sodium hydroxide solution using 2 drops of phenolphthalein solution as the indicator.
$>$ Titrate until you get a pink color.

## Calculation:

## 1. Calculate the quantity of citric acid present in our sample:

$\checkmark$ When the base neutralizes the acid (at the endpoint), the number of equivalents of acid $=$ the number of equivalents of base , therefore we can calculate the normality of citric acid from the following equation :-
$(\mathrm{N} 1 * \mathrm{~V} 1)$ Citric acid $=(\mathrm{N} 2 * \mathrm{~V} 2) \mathrm{NaOH}$

Where:
N1 :the normality of citric acid solution (unknown)
V1 :the volume of citric acid solution used (in our lab: 3ml)
N 2 :the normality of NaOH solution (in our lab: 0.25)
V 2 : volume of NaOH solution (the volume from coming out of the burette)

## Calculation:

$\checkmark$ Then, calculate the weight of citric acid from the following equation:

$$
\mathrm{N}=\frac{w t}{e q \cdot w t} \times \frac{1000}{v}
$$

## Note:

Eq.wt of citric acid $=64.4 \mathrm{~g}$ (why?)

## Calculation:

2. Calculate the percentage (w/w) of our citric acid sample:

| 12.5 g | 1000 ml |
| :---: | :---: |
| x | 3 ml |

note: $x$ sample weight

$$
\%=\frac{w t \text { of citric acid }}{\text { sample } w t} * 100
$$

## Thank You For Listening
